

The Crop is in The Drop

All the seed is deposited in two rows in each furrow, at an even depth, and covered with a uniform amount of earth. None on top for the birds, none insufficiently covered to start early and be killed by the hot sun—it all grows. Requires a fifth less seed.

THE MONITOR

DOUBLE DISC DRILL

As shown in cut above the tube passes through the opening in the foot in front of the standard, thereby necessitating the dropping of the seed in front of the bearing with the downward turn of the discs. The discs therefore aid to carry the seed to the bottom of the furrow, where it is all deposited at a uniform depth and covered with an even amount of earth. All other double discs are obliged to drop the seed BACK of the bearing, therefore it falls meeting the upward turn of the discs, which tends to lift and scatter the seed, making it impossible to deposit the seed at a uniform depth and cover it with an even amount of earth.
